ABSTRACT

5

In one embodiment, the invention may include a logic structure integrated in an integrated

circuit (IC), that has a set of bus inputs to generate events, a mask register to select inputs from

among the set of bus inputs, a logic register to select logic to apply to the selected inputs and an

event output to supply the result of the applied logic. The embodiment may further include a bus

interface integrated in the IC and coupled to the logic structure to transmit settable parameters to

28

the mask register and the logic register of the logic structure from an external agent.
